

# 1.11 URL/Web Forward and -Redirect

## How to make my domain name visible in the browser's 'Location'-bar?

### Frame-based URL Forwarding

Please visit the menu **DNS** in ['My Domains'](#) with the domain you want to add or modify an URL forward.

Now add a new record of type **"URL-Forward"**, or click the "edit" symbol  to change an existing one.

Click on **"Options"**, and mark the checkbox **'keep the URL'**, if you want your original (sub-)domain ('www.your-domain.com') to remain visible in the browser's 'Location'-bar.

Please find more information in [What is URL Forwarding \(Web Forwarding\)?](#)
