

Modify Zonedata

dns-zone-put

Requires:

<i>domain</i>	Zone (domain) name to store data to
<i>zone</i>	URL encoded zone data

Returns:

Replace current zone for provided domain with specified value.

Field "zone" will be parsed as multiline text (so usual line erminators are expected).

Warning: This request will overwrite current zone, i.e. all current ecords will be replaced by new records.

The format of zone is as follows (one record per line):

```
<label> <type> <pri> <target> <ttl> <valid-from> <valid-to> <parameter  
s(s)>
```

Please find a detailed description of format syntax at section [dns-zone-get](#).
