

Macros

name	DESCRIPTION	URL
alias	DESCRIPTION	URL

An existing contact (@namecat or @name-alias (name only))

This means an existing contact handle in the JOKER DATABASE.

Example:

```
owner-contact-handle:CNMAG-170209
admin-contact-handle:CNMAG-170209
tech-contact-handle:CNMAG-170209
billing-contact-handle:CNMAG-170209
```

If clear you have entered a non-existing contact handle, the system will send you an errormail.

It is also possible to set a reference to a contact definition, which has been made earlier within the current request. To do so, please use the following syntax:

```
admin-contact-handle:same-as-owner-contact
```

```
tech-contact-handle:same-as-admin-contact
```

```
billing-contact-handle:same-as-tech-contact
```

The @name-alias makes always replace the value for the specified contact handle with the email address of the macrotarget. If the referenced contact has to be created with this request, it takes the result handle.

Keep in mind that for name requires the contact handles for (com/net)contacts are not allowed. If you are referencing to a shortcut like handle@joker.net, you will get an error.
